Paper Title

Recent Advances in Fusion-Based Multimodal Sentiment Analysis

Track Name

Track 11: Recent trends in AI and Machine Learning

REVIEW QUESTIONS**1. Overall evaluation:**

accept

2. Reviewer's confidence:

high

3. Relevance of the contribution to the ISED audience

marginally relevant to computing education research

4. Writing and expression

well written and expressed

5. Strength of the paper

It is a comprehensive and descriptive survey of fusion-based multimodal sentiment analysis (MSA). The strengths of the paper lie in its articulate and detailed description of the three key fusion techniques, namely early, late and hybrid fusion. It gives a good background knowledge to the readers explaining clearly each method, its benefits and drawbacks, and recommending those that would be better to use in a table of comparison. The architecture tables and architectural diagrams that the article provides are especially useful in visualizing the various architectures and drawing a comparison of their performance characteristics e.g. accuracy, cost of computation and scalability. The discussion of practical uses in fields such as social media analysis and consumer responses is also good, which has served well to prove the usefulness of fusion-based MSA. In addition, important topics like data synchronization, computational complexity, model robustness, and ethical considerations are discussed, which gives a clear picture of challenges in this sphere.

6. Please provide your comments to improve the quality of the article. This is visible to the authors.

The manuscript is composed with skill and constitutes a useful overview of fusion-based multimodal sentiment analysis. In order to improve its quality and impact, I recommend several areas for enhancement.
