Paper Title

Predicting Customer Churn in Digital Banking with AI-Powered Deep Learning Models

Track Name

Track 5: Machine Learning, Autonomous Systems, and Robotics

REVIEW QUESTIONS**1. Is the paper within the scope of the conference?**

Yes

2. Novelty of the paper

High

3. Are the presented concepts well-articulated, and are the contributions effectively highlighted?

Yes

4. Is the presentation well-structured in terms of language clarity, figure and table quality, and overall organization?

Excellent

5. Does the manuscript include a comprehensive literature review with properly cited references?

Excellent

6. Overall Evaluation:

Accept

7. Confidence of the reviewer in the topic of the manuscript

High

8. Reviewer Comments to the Authors

- ☐ The paper tackles this critical issue in digital banking where there is a need to curb customer churn and this has been suggested through the adoption of an AI-enabled deep learning model to forecast customer churn successfully.
- ☐ It employs a new Recurrent Neural Network (RNN) model, and it takes plenty of data preprocessing procedures like data balancing (SMOTE) and data scaling (Min-Max) to obtain the sequential patterns of customer behavior.
- ☐ The results of the RNN model are impressive and achievable: 96.65 percent in accuracy, 96.67 in recall, 96.59 in precision, 96.44 percent in F1-score, and the AUC is 0.99 out of 1.0 indicating that, compared to the conventional models, the GBM and Random Forest, the RNN model produces better results.
- ☐ The paper has a detailed literature review and sharp visualizations (e.g., churn
