Paper Title

Predicting Credit Scoring in the FinTech Era: A Study of Machine Learning Algorithms

Track Name

Track 5: Machine Learning, Autonomous Systems, and Robotics

REVIEW QUESTIONS**1. Is the paper within the scope of the conference?**

Yes

2. Novelty of the paper

Medium

3. Are the presented concepts well-articulated, and are the contributions effectively highlighted?

Yes

4. Is the presentation well-structured in terms of language clarity, figure and table quality, and overall organization?

Good

5. Does the manuscript include a comprehensive literature review with properly cited references?

Excellent

6. Overall Evaluation:

Strong Accept

7. Confidence of the reviewer in the topic of the manuscript

High

8. Reviewer Comments to the Authors

☐ The paper achieves good balance in covering the shortcomings of conventional credit scoring in the FinTech context and also having a good methodology, such as data preprocessing (missing values of 32 percent on the column called OCCUPATION TYPE), feature selection with RFE and handling class imbalances using SMOTE.

☐ The suggested XGBoost model conveys exceptional performance parameters, attains 99.69 percent excellence, 99.33 percent precision, 99.33 percent recall, 98.61 percent F1-score, and a 0.997 AUC dimension.

☐ Since we have a clear picture of the comparative analysis, it is evident that XGBoost performs better compared to both the Random Forest and Decision Tree (accuracy 82%, precision 81%, recalls 82%, F1-score 80) and overall 74.3% against Decision Tree (accuracy 73.1%, precision 73.1%, recalls 75.4%).
