Paper Title

An Enhanced Mechanism for Deep Learning based Spam E-Mail Detection

Track Name

Nanoelectronic, VLSI and Sensor Systems (NVS)

REVIEW QUESTIONS**1. Overall evaluation:**

border line

2. Reviewer's confidence

Expert

3. Relevance of the contribution for IEEE-iSES 2025

reasonable appropriate

4. Contribution to the computing education research field

minor contribution, perhaps with the promise of more to come

5. Likelihood of generating discussion at the conference that will benefit the field

neutral

6. Best Paper Recommendation?

No

7. Paper for poster presentation recommendation?

Yes

8. Paper comments:

Using the Enron Corpus, the paper proposes a CNN-based spam email detection model that is enhanced by Sand Cat Swarm Optimization (SCSO). Although the incorporation of bio-inspired optimization is innovative, the paper does not provide architectural transparency, lacks a thorough comparison with contemporary deep learning baselines, and does not address deployment considerations. The SCSO algorithm lacks mathematical precision and pseudocode in its conceptual description, which constrains reproducibility. The evaluation metrics used are standard (Accuracy, Precision, Recall), yet there is no confusion matrix or error analysis included. Ablation studies, deeper benchmarking, and a discussion of real-world applicability would enhance the work. It is advisable to use poster presentations so that authors can fine-tune
